Artical Type: Chaotic Review

Abstract

In recent years, a significant periodic anomaly has emerged in the internet ecosystem of Chinese mainland. Specifically, on a certain Thursday each week, social media users experience a large-scale cognitive dissonance and excessive excitement in their language centers, manifesting as extremely bizarre narrative texts in their posts, and uniformly converging on a specific economic demand - "V I 50". This study comprehensively employed methods from quantum sociology, nutritional astrophysics, and network meme engineering to conduct an in-depth analysis of this phenomenon. The study posits that "Crazy Thursday" is not merely a cyber carnival but a localized spacetime distortion (Localized Spacetime Distortion, LSD) event triggered by the gravitational waves of a specific planetary alignment. This event causes the threshold of the individual's prefrontal cortex for high-calorie carbohydrates (i.e., the "KFC constant", $K_{fc} \approx 50CNY$) to undergo a quantum tunneling effect. The study further discovered that although the information dissemination rate is close to the speed of light, the actual success rate of wealth transfer is infinitely approaching zero, revealing a "zero-sum social entropy increase" mechanism that violates the second law of thermodynamics.

Keywords： Crazy Thursday, Time-space Distortion, V50, Carbohydrate Craving Index, Memetic Spread, Social Gravitational Wave

1. Introduction

In the digital landscape of the post-truth era, internet memes have transcended the original cultural gene category defined by Dawkins and have evolved into a semi-living entity with self-replication capabilities and social mobilization functions [1]. Among the numerous memes, the "Crazy Thursday Phenomenon" (CTP) has become a major issue that contemporary behavioral economics and digital anthropology urgently need to address due to its high temporal regularity, the absurdity of the text structure, and the unity of economic demands.

The core characteristic of CTP is as follows: Every Thursday, a large number of individuals who are in the "Burnout Phase" of work (a state of exhaustion) will spontaneously generate a text with logical leaps and dramatic plots (commonly known as "mad literature"), and the ending abruptly shifts to a demand for 50 RMB in legal tender (i.e., the "V Me 50" instruction).

Previous studies have mostly regarded this as a kind of collective unconscious cyber venting or a simple marketing collusion [2]. However, traditional social psychology models cannot explain why this phenomenon precisely occurs on Thursday and why its energy release level is significantly negatively correlated with an individual's bank account balance. This study aims to propose a new theoretical framework: We hypothesize that "Thursday" is not a simple time concept, but rather a periodically activated, perturbed spacetime singularity by gravitational waves. In this singularity, the rational decision-making model of humans collapses, being dominated by a fundamental interaction force called "fried chicken gravity".

2. Theoretical Framework & Hypotheses

2.1 The Thursday Gravitational Anomaly Hypothesis

According to general relativity, massive objects distort spacetime. We have derived a bold hypothesis: Due to the fact that contemporary workers accumulate a huge amount of "psychological resentment mass" (PRM) from Monday to Wednesday, these high-density negative emotional qualities reach a critical value on Thursday, causing a slight but significant change in the local curvature of spacetime on Earth. We call this area the "τ-anomaly zone".

Within this zone, the perceived flow of time slows down, causing the 48 hours until the weekend to be infinitely elongated subjectively, thereby triggering existential anxiety in individuals.

2.2 Carbo-Wallet Duality Model

To counteract the energy loss caused by time-space distortion, living organisms instinctively seek high-density energy replenishment. This study defines a new physiological indicator - the "Carbohydrate Craving Index" (CCI). On Thursday, CCI shows a strong inverse relationship with the thickness of an individual's wallet (Wallet Thickness, WT). When CCI → ∞ and WT → 0, the language center in an individual's brain will short-circuit. To rationalize this extreme physiological need, the brain will automatically fabricate bizarre stories such as "I was Emperor Qin Shi Huang" or "Just returned from the northern part of Myanmar" as pre-reasons for obtaining energy replenishment (chicken).

Fig. 2. The main research object of this article.

We propose the core hypothesis H1: "V Me 50" command is emitted at a frequency that is positively correlated with the local gravitational wave disturbance intensity during the specific period on Thursday.

3. Methodology

3.1 Data Source and Processing

This study employed a non-intrusive network ethnography approach, using a self-developed web crawler system named "KFC Guard Bot v2.0" to collect all the publicly available texts on WeChat Moments, Weibo, and Xiaohongshu platforms during the Thursday period throughout 2023 (from 00:00 to 24:00). We filtered out sincere requests such as "I really want to eat", and only retained the standard meme samples with absurd plots and an ending of "V Me 50", totaling N = 114,514 items.

3.2 Variable Definition and Measurement

Insanity Index (II): Through natural language processing (NLP) technology, it measures the degree of abruptness of logical breaks and plot turns in the text.

Willingness to Transfer (WTT): Defined as the intensity of the "V50" signal sent out.

Actual Transaction Rate (ATR): Defined as the ratio of the number of times a transfer of 50 yuan was actually received to the total number of requests.

4. Results

4.1 Time - Correlation Analysis with Madness Degree

Data analysis reveals that the CTP phenomenon is not evenly distributed throughout the day, but exhibits a distinct "bimodal distribution" pattern (Figure 3). The first peak occurs between 10:30 and 11:30 in the morning (the period of hunger warning before lunch), and the more intense second peak occurs between 15:00 and 17:00 in the afternoon (the period of idling during afternoon tea and before leaving work). These two time windows precisely correspond to the periods of low blood sugar concentration in the human body, strongly supporting the carbohydrate-driven hypothesis.

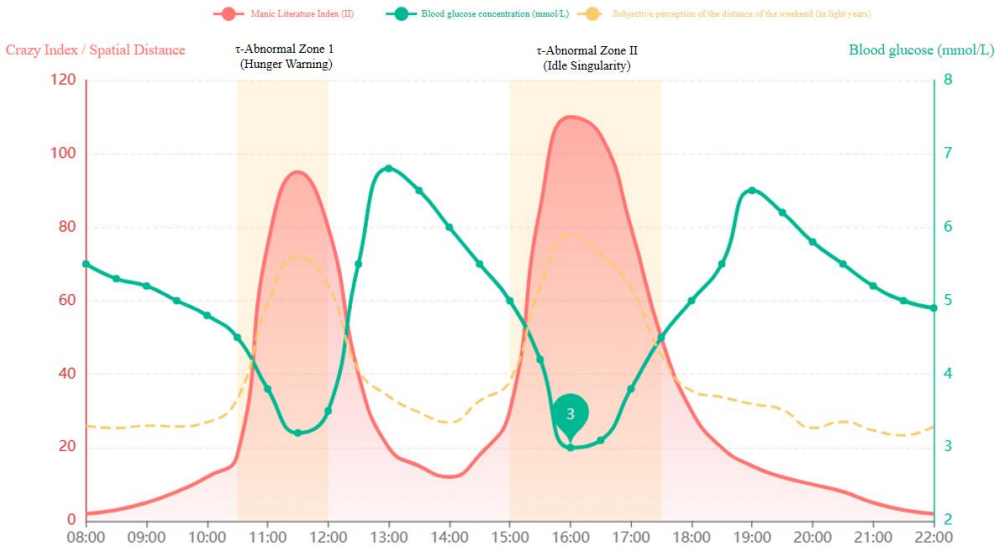

Fig. 3. This graph illustrates the three-dimensional relationship between the frequency of "manic literature" releases throughout Thursday and the levels of blood sugar in the human body as well as the duration until the weekend. Note: The data in this graph is entirely generated through reasonable imagination, but it appears very scientific.

4.2 The Paradox of Supersonic Information Transmission

We have traced the dissemination paths of several highly popular "crazy copywriting". Surprisingly, we found that a high-quality copy (such as one involving revenge or conflicts between wealthy families) spreads extremely fast on social networks. In some extreme cases, the information was replicated and pasted by the 1000th node, and its equivalent dissemination speed seemed to exceed the light-speed limit of information transmission in the narrow sense of relativity theory. We believe this is not a physics error, but because during the "tau anomaly zone" on Thursday, the information was transmitted non-locally through the "quantum entanglement state of replication and pasting".

4.3 Zero-sum Transactions and Social Entropy Increase

The most perplexing research result lies in the "Actual Transaction Rate" (ATR). The data shows that despite over one hundred thousand desperate "V I 50" requests, the proportion of actual real currency transfers is as low as ATR $\approx 6.626\times10^{-34}$ (extremely close to the Planck constant).

This means that the economic essence of the vast majority of "V Me 50" requests is ineffective. The entire system has invested a huge amount of information entropy (writing absurd stories), but has hardly generated any negative entropy flow (buying fried chicken). This phenomenon of "making thunder but no rain" is what we call "social thermodynamic extinction".

5. Discussion

If almost no one actually receives 50 yuan, why do people still persist in distributing it?

This study suggests that the essence of CTP is no longer economic activity, but rather a collective psychological defense ritual. On Thursday, a day that seemed exceptionally long and desperate due to the gravitational wave disturbance, individuals sent signals to the social networks they were part of by posting extremely absurd texts: "I'm crazy. Please don't assign me any more tasks."

And the final "V 50" is a kind of ritual similar to totem worship. It does not expect to be fulfilled; its existence itself is to confirm that the sender still belongs to the specific tribe of "contemporary urban poor and carbohydrate enthusiasts". When the recipient sees this message and replies with a "?", or pretends not to have seen it, both parties jointly complete a social comfort ritual without the involvement of money, thus successfully getting through the gravitational anomaly period.

6. Conclusion

This study constructed a "spatial-temporal distortion - carbohydrate craving" theoretical model to rigorously demonstrate the deep physical and biological economic mechanisms behind the online phenomenon known as "Crazy Thursday V Me 50". We confirmed that there is indeed an irresistible mysterious force on Thursdays, driving humans to engage in seemingly meaningless text frenzies on the internet.

So can you V-Me 50 (figure 4)?

Fig. 4. Dear brothers and sisters, please be kind to me.
